|--|--|
| Superficie forestal afectada por incendios | 1998 fue un año particularmente grave en materia de incendios forestales. Aunque no es el único año considerado crítico en este rubro, en él se combinaron numerosas quemaduras agrícolas que salieron del control de los productores agropecuarios y condiciones meteorológicas - no registradas en los últimos 70 años, aproximadamente- que propiciaron la propagación de los incendios. Entre estas últimas están: intensas lluvias en 1997 que se tradujeron en gran acumulación de biomasa vegetal; heladas, vientos intensos sin humedad, precipitaciones menores y temperaturas elevadas durante 1998 que provocaron que la biomasa acumulada se desecara y se convirtiera en combustible fácil de incendiar. Debido al redondeo en las cifras, algunos totales no coinciden con su suma pero así lo reporta la fuente. Los datos presentados son al 31 de diciembre de 2007 |
